Get paid to reduce phosphorus runoff into the Huron River and Lake Erie with sustainable and profitable long-term conservation approaches that benefit your whole farm.

Work with us to explore flexible and cost-effective conservation techniques for your farm. Your farm and field data combined with watershed-level nutrient and economic modeling will predict measurable phosphorus reductions. You choose which techniques are best for you and become eligible for payment if and when you implement them.

Whole Farms for Clean Water can guarantee a minimum payment of $20 per acre for reducing phosphorus runoff. This offer applies to the first 1,000 acres that commit to carrying out our recommendations. The bigger your phosphorus reduction, the more you get paid.

Check our map at the project website to see if your farm is in an eligible Washtenaw or Livingston county area.
